Harper Corporation of America and Adphos Demonstrate Printed Electronics at PRINT 17

Charlotte, North Carolina, September 6, 2017—Global anilox roll supplier Harper Corporation of America will provide Adphos North America, Inc. with a QD™ Flat Bed Flexo Proofer to demonstrate flexographic printing capabilities for flexible printed electronics.

Demonstrations will take place live on the PRINT 17 show floor at Adphos North America's booth #2348 from September 10 to September 14 at McCormick Place in Chicago. The QD™ Flat Bed will print a simulated electronic circuit using carbon ink. The printed samples will be dried in line with an adphosNIR[®] curing solution so that attendees can see electrical conductivity in the printed sample.

Harper Corporation of America is proud to provide its cutting-edge technology to demonstrate how post-print systems can work together in the flexographic printing process. The adphosNIR[®] as demonstrated is available as an option on the QD™ Flat Bed Table.

Harper and the Adphos have collaborated and showcased the QD™ Flat Bed Flexo Proofer at previous conferences and trade shows in the United States and Europe, but this is the first time both are joined together to showcase the QD™ Flat Bed Flexo Proofer at a GASC event.

For more information, please contact Jazmin Siancas at 704-588-3371, ext. 4292, or jsiancas@harperimage.com.
